

MI PASTE PLUS

MI Paste Plus contains: milk protein (recaldent), 2% sodium fluoride, and calcium phosphate.

Caution: Do not use MI Paste if you have a milk protein allergy or hydroxybenzoate allergy.

Beneficial for:

- Remineralization of tooth enamel/white spots. White spots (demineralization) can be caused by sodas, sugar products, poor brushing, and/or poor oral hygiene.
- Patient's currently in braces, helping to reduce the potential for white spots to form.
- Reducing tooth sensitivity, which is a common effect after tooth bleaching.

How to use:

- In most cases you can apply the MI Paste Plus after brushing your teeth with your regular toothpaste. MI paste can be used in the morning and/or evening.
- Squeeze a small amount of MI paste on your finger and apply over the surface of your teeth. You can also apply to areas around bands and brackets, as well as inside your clear retainer.
- Leave on teeth 3-5 minutes, then expectorate (spit out). Do not swallow! Do not rinse with water after application for maximum benefit.
